

EXPERIENCE

Precision Design & Engineering · Generative AI Engineer-Trainee Sep 2026 – Present · Jaipur, India

- Shipped **4 end-to-end production features in 3 weeks** across frontend, backend, extraction pipelines, evaluation tooling, and PDF/image processing for structural steel detailing workflows.
- Designed **Welga**, a preprocessing algorithm specialized for steel detailing drawings, now running in production; internal evaluation showed **substantially higher extraction accuracy** than the researched and open-source approaches tested.
- Built a natural-language AI agent harness for internal engineering workflows, allowing a single interface to inspect runs, execute tools, reason over failures, and operate the surrounding system.
- Worked across OCR, VLM extraction, document processing, structured outputs, evaluation datasets, and production deployment.

Freelance Software Engineer · Paid Client Projects 2026 – Present

Food Hunter

- Built and shipped a restaurant discovery app with **2,000+ users** and **50–200 DAU**, using bill scanning to rank restaurants from what people actually order and produce bill-verified reviews.
- Built the mobile client and backend with React Native, Expo, FastAPI, PostgreSQL, and Google Cloud Vision, including authentication, async processing, search, feeds, and bill extraction.

Pixel to Paint

- Building a design-first international e-commerce platform for a framed wall-art brand, owning the full system across frontend, backend, and hosting infrastructure with Next.js 16, Tailwind CSS, Motion, pnpm monorepo architecture, and Docker.

Anchorate · Co-Founder & CTO Jan 2026 – Aug 2026

- Designed **Anchor8**, a runtime control layer for autonomous AI agents that sits between agents and tools and classifies both tool requests and tool results as SAFE, DANGEROUS, or REVIEW.
- Designed the system around a proprietary classifier, automatic blocking and feedback for dangerous actions, human review for ambiguous cases, and continuous learning from human-judged cases.
- Built the SDK interception layer and an engineering harness for inspecting agent runs, reviewing failures and previous decisions, identifying vulnerabilities, and proposing or applying fixes.

BlinkAdz · Software Engineering Intern Feb 2025 – Apr 2025

- Built production software around LLM-powered workflows and backend systems, including LinkedIn and LinkedIn Marketing API integrations, gaining hands-on experience with AI pipelines, retrieval, orchestration, and deployment.

PROJECTS

Spoin · Knowledge Feed for Curiosity and Mastery github.com/anubhav-qt/spoin_bundle

- Building a knowledge feed designed to take a learner from curiosity to mastery, combining bite-sized cards with curricula, prerequisites, quizzes, deeper exploration, notes, and personalized ranking over a shared knowledge corpus.
- Designed the `spoin_universe` as the system’s source of truth and built **FROG**, a custom retrieval layer that grounds both generation and verification against that corpus.
- Architected the platform as an asynchronous content factory, knowledge warehouse, and serving layer, keeping LLM generation off the feed read path and feed interactions **near 50ms**.
- Built a quota-aware generation scheduler across API-key/model cells, reaching **499+ items/min** peak throughput, with **10,000+ cards** generated and provenance retained back to the knowledge chunks used for each card.

Breader · Self-Hosted Reading Platform breader.site · github.com/anubhav-qt/breader

- Built and operate a reading platform with **1,500 active users**, supporting EPUB, PDF, text, Markdown, browser-side TTS, sentence highlighting, offline-first storage, and key/account-based libraries.
- Designed and operate the production stack with Docker Compose, Cloudflare Tunnel, Cloudflare R2, PostgreSQL replication, encrypted age backups, monitoring, and Render fallback.
- Runs the primary production environment from a self-hosted machine with automatic fallback when the primary instance is unavailable.

PariBelle Ecosystem paribelle.in · github.com/anubhav-qt/paribelle-web · github.com/anubhav-qt/paribelle-backend · github.com/anubhav-qt/pom

- Designed and built a production commerce ecosystem spanning Next.js storefront/admin, NestJS API, PostgreSQL, and POM OMS, covering storefront operations, inventory, marketplace orders, dispatch, returns, finance, and warehouse workflows.
- Replaced a **₹42,000/year** order-management SaaS with POM, consolidating operational workflows into one system and substantially increasing client throughput.
- Built and operate the self-hosted deployment with Docker Compose, Caddy, Cloudflare Tunnel, database synchronization, encrypted backups, and Vercel/Render fallback.

EDUCATION

Manipal University Jaipur · B.Tech, Computer Science & Engineering · CGPA: 9.28/10 2022 – 2026

Dean’s List · Student Excellence Award, all 8 semesters · Vice Chair, IEEE GRSS

TECHNICAL SKILLS

Languages	Python, TypeScript, Rust, C++, SQL
Backend & AI	FastAPI, NestJS, Hono, LangGraph, SQLAlchemy, TypeORM, OpenCV, PyTorch
Data	PostgreSQL, pgvector, Redis, PgBouncer, Pinecone
Infrastructure	AWS, Docker, Docker Compose, Kubernetes, Linux, Caddy, Cloudflare Tunnel, Cloudflare R2, age
Frontend	Next.js, React, React Native, Expo, Tailwind CSS, Vite
Engineering	Distributed systems, async job processing, document processing, OCR/VLM pipelines, API design, evaluation systems, production infrastructure
